

## **Himoinsa Power Systems (Hipower) is on the scene at the Bakken, the biggest oil reserve in the USA**

Hipower and Hertz Energy Services are providing the necessary means to carry out energy generation and distribution tasks, during oil exploitation operations at the Bakken formation, a major oil reserve in the USA.

The Bakken is located between the mountains and South Dakota, with oil reserves equal to one tenth of those of Saudi Arabia. It is an amount of crude oil sufficient to maintain the USA's fuel consumption for 41 years. Hipower and Hertz Energy Services have provided one of the most technologically advanced energy solutions. These generators stand out for the strength and robustness of their fuel reservoir. They are energy generators that can be rented as mobile energy sources.

More than 20 rental power units generating prime power between 20 and 1000KW have been supplied and distributed throughout the Bakken area. They are hi-tech winter pack generators

combine the vast experience that Hertz and Hipower have in the energy sector to guarantee continuous operation. Both companies provide comprehensive service, from the supply and management of the shipment to maintenance and technical support for power generators in the field. Failure of the power supply is not an option. Reliable and easily transportable energy sources that are resistant to harsh weather are needed due to the Bakken formation's inaccessible mountainous location.

The products supplied include winter pack, a series of options that make them resistant to temperatures of  $-15^{\circ}\text{C}$ . These options include grilles that are automatically activated with a thermostat, a hydraulic heater for the cooling liquid, a control box heater, and an engine block heater.
